Part 7

To count the number of words in the document, scan from left to right and line by line. On each line, there will either be a word, not a word or both. When not a word is reached, skip it, and when a word is reached, tally it. Not a word is any space, symbol, number or combination of the three. A word is defined as the letters in between the not a words.

Part 8

I found powershell very frustrating, back when I did python I used pyscripter and expected to be coding in a similar IDE. I was confused about what to put into the terminal and how to problem solve when

there were errors. I tried going through the guides but just kept getting errors. Once I was actually in pycharm and worked on part 6 it was pretty straight forward. Writing the instructions in English was confusing to me at first of what that even means but then I just went for it because I realized there wouldn't be any errors like when writing code.
